

History

1900 - 1933

In the year 1900, production of potato starch on an industrial scale took place for the first time in Denmark.

Karup Model Anno 1933.

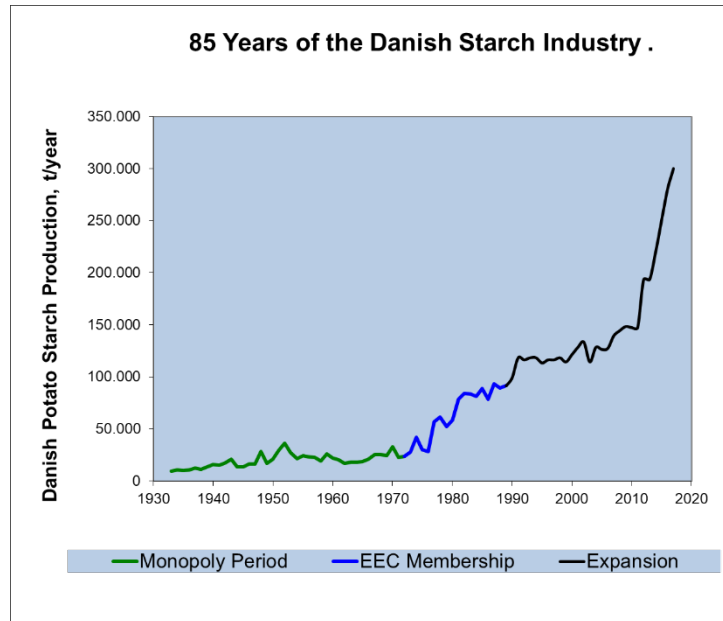

1933 - 1973

In 1933 a protective legislation was introduced - a monopoly. This protection of the industry continued until Denmark joined the European Economic Community (EEC) in 1973.

1989-

A quantum leap ahead began late eighties. Over a five-year period, the factories were modernized, and their capacity multiplied.

When the EU-quota system was lifted 2011 the expansion could take on again. More than 85 % of our Danish potato crop is processed into starch and exported.

For the Danish starch industry, there seems to be only one way.

Thousands of tonnes of native potato starch are each year filled in road tankers from silos like this one.

Home

Toftlund Factory

When we began the modernization program the factory in Toftlund produced 4 t/h of native starch. In 1989 the first roofed and automated potato store was erected. Next the overall capacity was tripled to 12 t/h of starch.

Exactly 25 years later we were asked to triple the capacity once more.

Karup Anno 2017

Karup Factory

The factory in Karup was one of four factories multiplied in these years. Since then more capacity has been added.

Most recently we have been contracted to double the present capacity to a total of 70 t/h of native starch ~ >300 t/h of fresh potatoes.

... and Sales welcomes!
